Instrument List:

- [Green](#)

Discussion:

SN70 and SN38 were visited today. Both have been operating in a stable manner.

A yagi cellular antenna was installed at SN70, which significantly improved cellular signal strength (-61 dBm vs. -78 dBm). A yagi was also tested for SN38 with only marginally better results.

Remote VNC Update: The current model (UML295) firmware does not allow port forwarding or port pass through. I have been in contact with VZW technical support and they continue to try and find a solution. If no solution is presented tomorrow, then I suggest purchasing the previous model usb modems (UML290) and taking a hammer to the UML295s.
